Notation

But what *is* “A”?

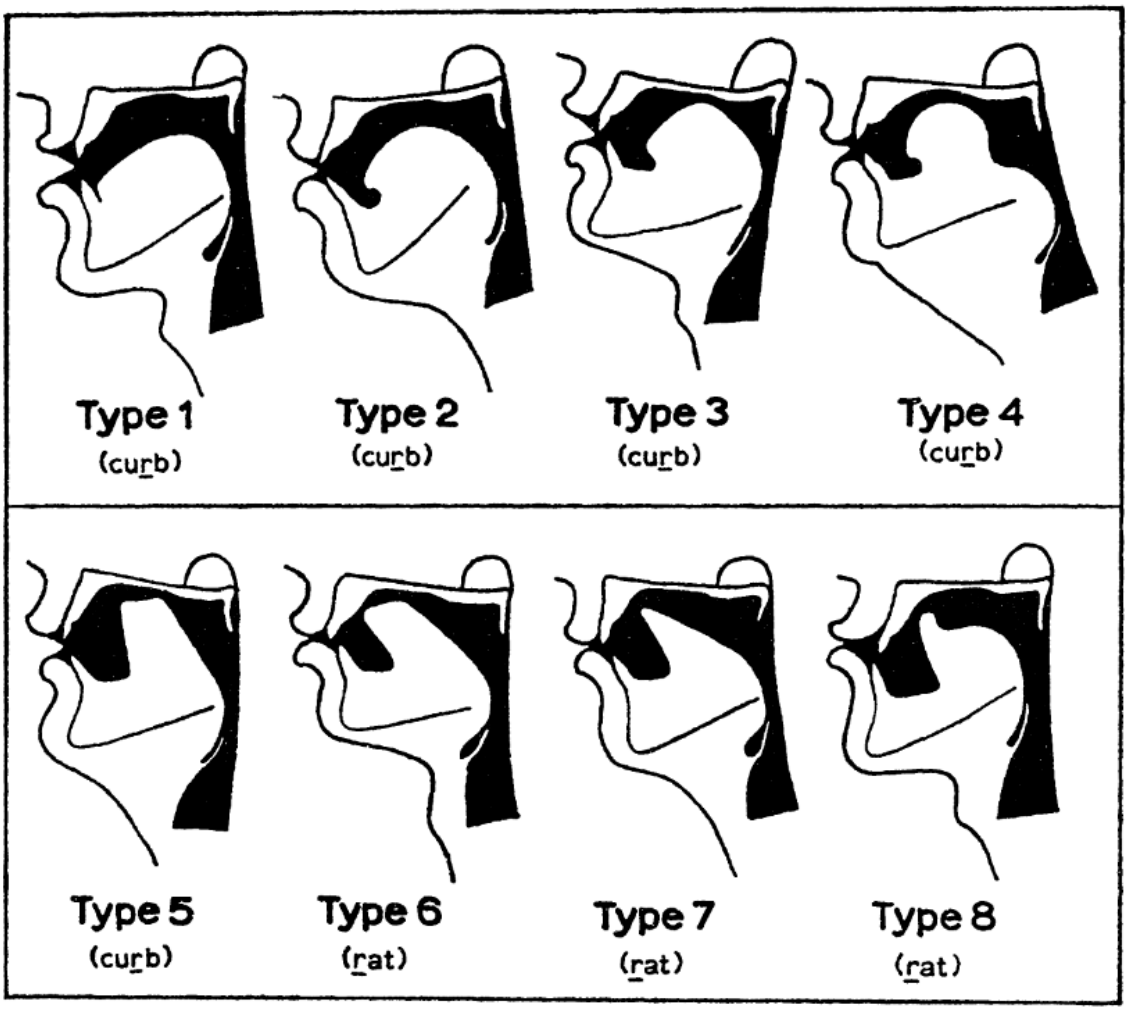

Transcription

There have been different conventions for what frequency “Concert A” should be!

440Hz how?

ɹ how?

Place & Manner

Place

- *Where* the point of greatest constriction is.

Manner

- *What* happens at that place of constriction.

Place

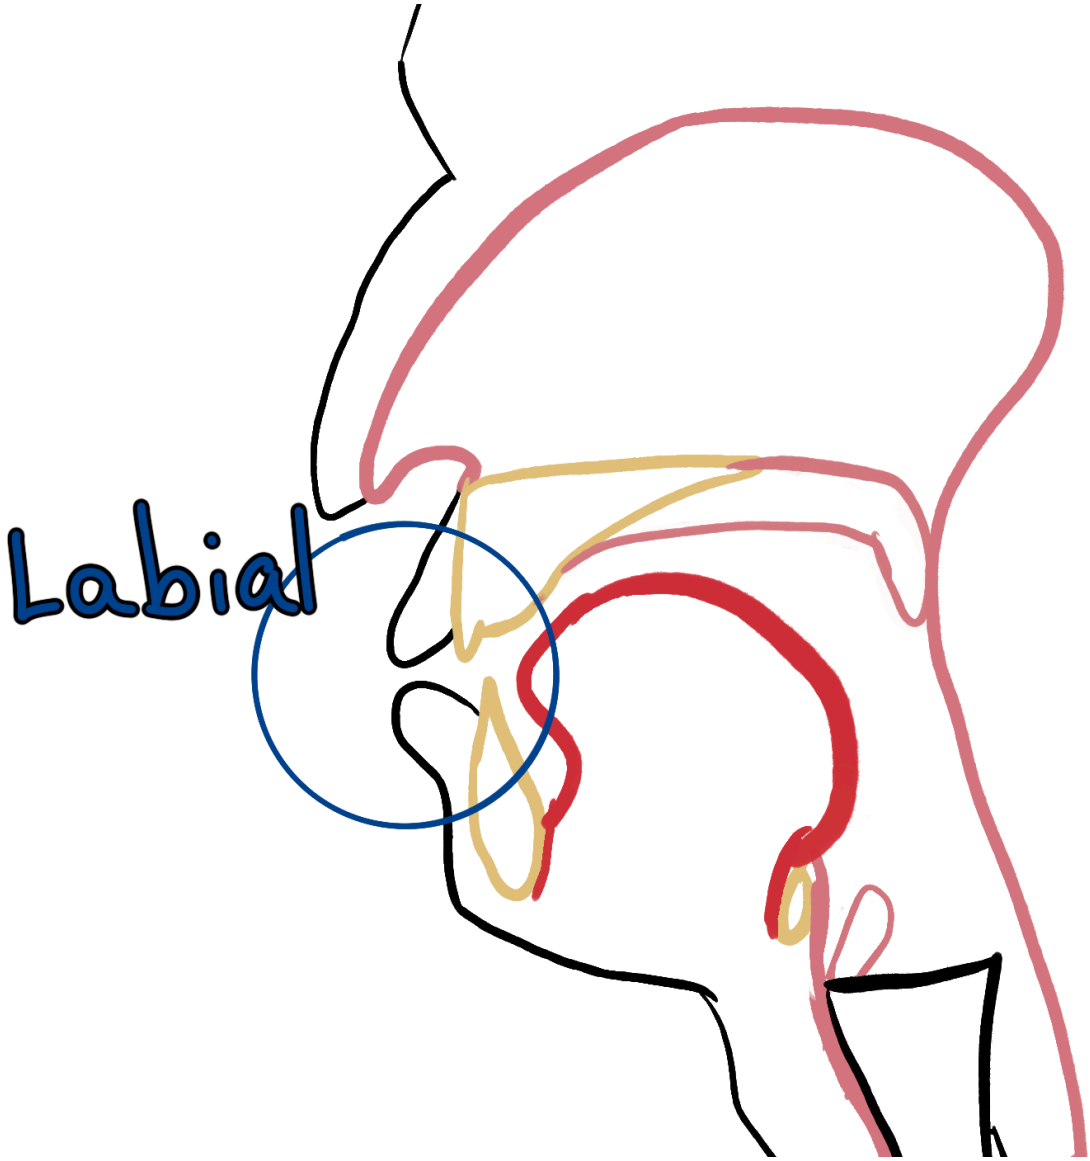

Place

Most articulations have an *active* and a *passive* articulator

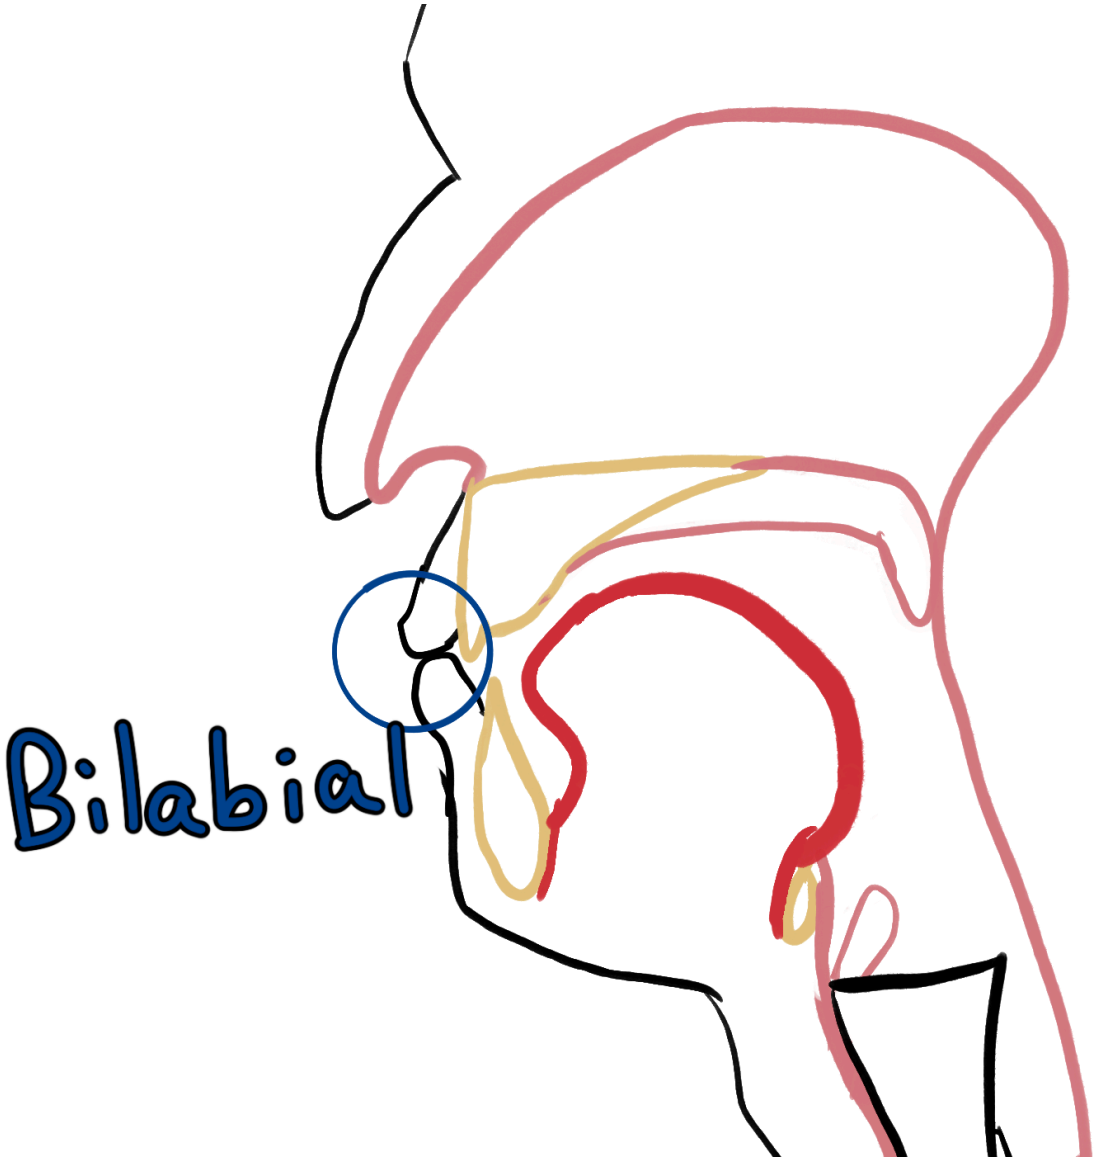

- Active: the articulator that moves
- Passive: the articulator that gets moved to

Most places of articulation are named for the location of the passive articulator.

Place

There are also terms based on the active articulator involved.

- Front of tongue: Coronal
  - Tip of tongue: Apical
  - Blade of tongue: Laminal
- Back of tongue: Dorsal

Place

Apical	Laminal
ʂ, ʐ	ç, ʝ
(retroflex)	(palatal)

Manner

Manner

What happens at each place of articulatio.

Manner

Oral Stops/Plosives

- Full constriction between articulators
- No oral airflow
- No nasal airflow

Manner

Trills & Taps

- Trills
  - Articulators held loosely together, allowing for airflow to generate the Bernoulli effect
- Taps
  - A very fast, glancing articulation.

Manner

Nasals and trills are assumed to be voiced, but if they're voiceless we use an under-dot to indicate that.

Fricatives

- Close, but not complete constriction of articulators
- Turbulent airflow

“Rhotics”

Rhotics aren’t a phonetically coherent set of sounds. Sounds classified as rhotics include

- alveolar trills
- uvular trills
- uvular fricatives

- velar fricatives
- alveolar taps
- retroflex approximants
- alveolar approximants
- whatever bunched [ɹ] is

“Rhotics”

As the name would suggest, these are sounds spelled with characters derived from Greek “ρ”.
